# EASY-ROB™

Tutorial

## 1 Your guide

### 1.1 Product Overview

#### An overview of the most important EASY-ROB™-documentations

This tutorial is intended to explain and to show you the most fundamental EASY-ROB™-functionalities, such as creating and loading a work cell with its associated simulation program. It contains lessons with step-by-step examples, which should be exercised carefully. Regardless of this tutorial you should become familiar with the 3D-simulation software in advance. To help you, you have access to a lot of important and detailed documentations. This guide shows you, which documentations are available.

There are 3 ways to access these documentations:

- 1) **Online:**  
<https://easy-rob.com/en/downloads-2/>
- 2) In the **CD-directory** under [Manual](#)
- 3) In the **Installation-directory** under [Manual](#)

#### 1. Product Description

Are you interested in other EASY-ROB™ products? Or do you just want to get information about the features of the single versions?

Take a look into the product description

>> [EASY-ROB-ProductDescription.pdf](#)

# EASY-ROB™

Tutorial

## 1 Your guide

### 1.2 EASY-ROB™ Multi-Robot Version

#### 1. Tutorial

This tutorial is intended to explain and implement the most fundamental EASY-ROB™ functionalities. In a step-by-step instruction with a reference to examples you will learn here how to use EASY-ROB™.

This guide is part of the TrainLib-Tutorial.

>> [TrainLib-Tutorial\\_ENG.pdf](#)

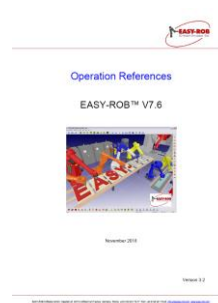

#### 2. Operation References

The Operation References will be a helpful assistant while working with EASY-ROB™. It contains detailed basic information which is required for to use all software features from beginning in proper way.

The user will find information about the system files for the start configuration and the environment, description about short keys or the main dialogs as well as short tutorials

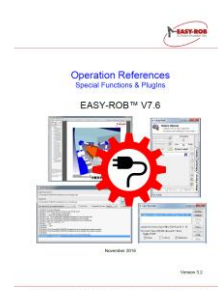

>> [Operation-References.pdf](#)

#### 3. Operation References – Special Functions & Plug-Ins

The Operation References – Special Functions & Plug-Ins are an extension to the Operation References. They contain detailed information to the EASY-ROB™-Plug-Ins as well as the special functions.

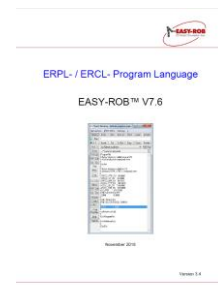

>> [Operation-References-Functions-PlugIns.pdf](#)

#### 4. ERPL- / ERCL-Programming Language

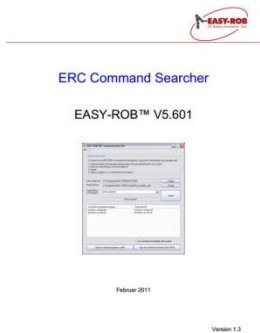

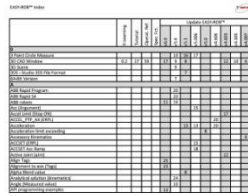

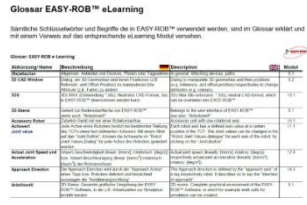

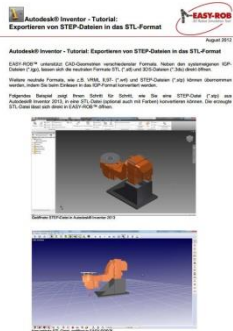

This description gives an overview about the EASY-ROB™ program structure and the available robot motion commands

>> [EASY-ROB-ERPL\\_ENG.pdf](#)

EASY-ROB™ Multi-Robot Version

<h2>5. Update-Descriptions</h2> <p>All new features of an updated EASY-ROB™ version are documented and described in the associated update descriptions.</p> <p>Use the Update descriptions to gain an overview of the new features of current or older versions and to familiarize yourself with their function.</p> <p>&gt;&gt; <a href="#">Update-ER_v8003-2019_ENG.pdf</a></p>	
<h2>6. EASY-ROB™ Short Keys</h2> <p>The EASY-ROB™ user interface can be operated by using the mouse and or the keyboard by so-called short keys. This document provides an overview of all buttons and short keys and describes their function.</p> <p>&gt;&gt; <a href="#">EASY-ROB-ShortKeys_ENG.pdf</a></p>	
<h2>7. EASY-ROB™ Dialogues</h2> <p>The most important EASY-ROB-dialogues as overview and how to open them.</p> <p>&gt;&gt; <a href="#">EASY-ROB-Dialogues.pdf</a></p>	
<h2>8. Adding a 7th tracking axis</h2> <p>Learn how to add a 7th tracking axis.</p> <p>&gt;&gt; <a href="#">Tracking-Axis.pdf</a></p>	

<p><b>9. ERC Command Searcher</b></p> <p>The ERC Command Searcher will support the user to search for a specific ERC commands in the example library “Proj_example_erpl”, which is normally installed in the directory: “.\EASY-ROB\Tutorial\Proj_example_erpl</p> <p>This description shows how to use the ERC Command Searcher.</p> <p><a href="#">&gt;&gt; ERC-Command-Searcher_ENG.pdf</a></p>	
<p><b>10. Index</b></p> <p>The index makes it easy to search for terms and to seek the corresponding detailed explanations in the operation references, update descriptions of older versions and eLearning modules.</p> <p><a href="#">&gt;&gt; EASY-ROB-Index.pdf</a></p>	
<p><b>11. Glossar EASY-ROB™ eLearning</b></p> <p>All keywords and terms that are used in EASY-ROB™ are explained in the glossary. They are also provided with a reference to the corresponding e-learning module.</p> <p><a href="#">&gt;&gt; Glossar_DE_ENG_CHS.pdf</a></p>	
<p><b>12. eLearning platform</b></p> <p>In cooperation with the Handwerkskammer Münster an eLearning platform with a total number of 25 modules for EASY-ROB™ has been created. This feature is only available in german language.</p> <p>You can access the e-learning modules from the customer area of our website at <a href="https://www.easy-rob.com/en/service/training.html">https://www.easy-rob.com/en/service/training.html</a>. As part of your EASY-ROB™ software maintenance and support contract, you can use this platform free of charge.</p> <p><a href="https://www.hbz-online.de/login/index.php">https://www.hbz-online.de/login/index.php</a></p>	
<p><b>13. Autodesk® Inventor - Tutorial: Exporting STEP-files into STL-format</b></p> <p>This documentation shows step-by-step how to convert a STEP-file (*.stp) into a STL-file (optionally with colours) using Autodesk® Inventor 2013. This STL-file can be opened directly with EASY-ROB™.</p> <p><a href="#">&gt;&gt; Autodesk-STEP2STL-Tutorial_ENG.pdf</a></p>	

# EASY-ROB™

## 1 Your guide

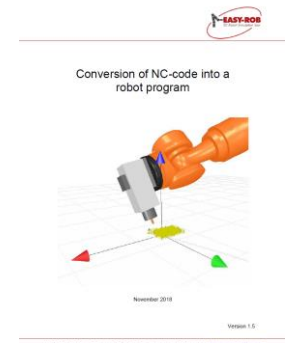

Tutorial

### 1.3 EASY-ROB™ Options

#### 1. Conversion of NC-code into a robot program

This description shows you how to create a path with tagpoints out of a NC-code and how to convert it into a manufacturer-specific robot program, by using EASY-ROB™.

>> [EASY-ROB-NC-Import-Description.pdf](#)

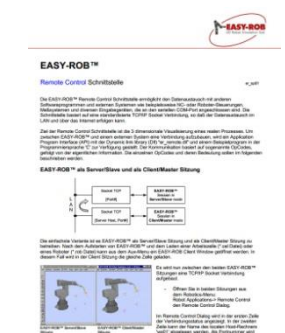

#### 2. EASY-ROB™ Remote Control

The EASY-ROB™ remote control feature with TCP sockets allows it to interchange data with other programs, such as Robot or NC machine controller. An Application Program Interface (API) is provided with the Dynamic link library (DLL) "er\_remote.dll".

This document describes the function and how to use the remote control feature.

>> [Remote-Description-Ext\\_ENG.pdf](#)

# EASY-ROB™

## 1 Your guide

### 1.4 EASY-ROB™ API

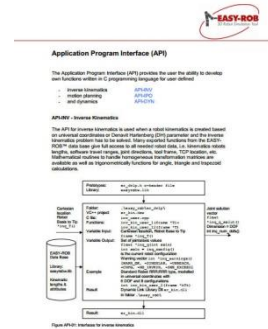

Tutorial

#### 1. API-Description

The Application Program Interface (API) provides the user the ability to develop own functions written in C programming language for user defined inverse kinematics, motion planning and dynamics.

CD-directory: [.Manual\API\API-Description.pdf](#)

Installation-directory: [.Manual\API-Description.pdf](#)

#### 2. API-Sensor: Programmable Sensor interface

The sensor interface allows the user to connect an external device - like a SpaceMouse or a digitizer to capture axis angle and cartesian positions - and visualize the data direct in EASY-ROB™.

CD-directory: [.Product-Info\API-Sensor\\_DE.pdf](#)

Installation-directory: [.Manual\API-Sensor\\_ENG.pdf](#)

#### 3. API-UserDll

The optional API-UserDll is an enhancement of the EASY-ROB™ programming interface and enables you to create user specific dialogs that can be loaded automatically at the startup of EASY-ROB™. By using the API UserDll EASY-ROB™ can easily be customized to fit the customer's needs.

CD-directory: [.Product-Info\ API-UserDll\\_ENG.pdf](#)

Installation-directory: [.Manual\API-UserDll\\_ENG.pdf](#)

## EASY-ROB™ API

### 4. API - Doxygen documentation of methods class ER\_CAPI

For the control of EASY-ROB™ and for individual product customization the methods class ER\_CAPI provides a variety of functions that are documented with doxygen.

The documentation is available as Browser-version (index.html) and as compiled HTML-file (\*.chm).

Online: <https://www.easy-rob.com/en/product/extensions/apis-additional-options.html>

CD-directory: [.Manual\API\EASY-ROB ER\\_CAPI.chm](#) or [.Manual\doxygen\\_ER\\_CAPI\html\index.html](#)

Installation-directory: [.Manual\EASY-ROB ER\\_CAPI.chm](#)

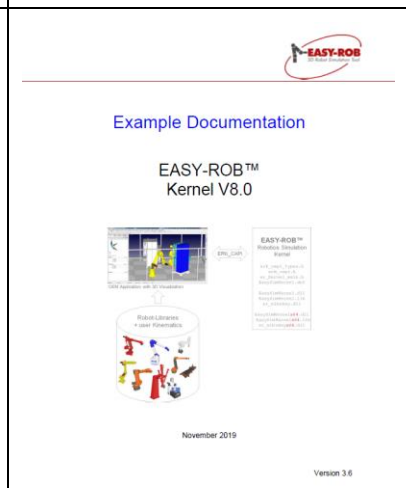

### 5. EASY-ROB™ Kernel - Example Documentation

This documentation shows and describes examples for the „EASY-ROB™ Kernel“.

Online: <https://www.easy-rob.com/fileadmin/Userfiles/doc/erk/erk-example-documentation.pdf>

CD-directory: [.Manual\API\ERK-Example-Dokumentation.pdf](#)

Installation-directory : [.Manual\ ERK-Example-Dokumentation.pdf](#)

### 6. API - Doxygen Dokumentation der Klasse ERK\_CAPI

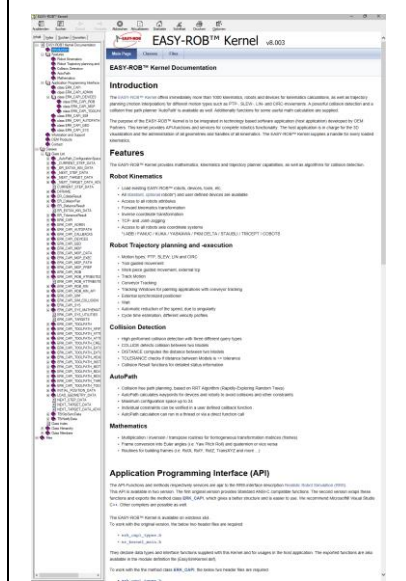

For the integration of the EASY-ROB™ Kernel in your own technology-based software solutions the methods class ERK\_CAPI provides a variety of functions that are documented with doxygen.

The documentation is available as Browser-version (index.html) and as compiled HTML-file (\*.chm).

Online: [https://easy-rob.com/fileadmin/Userfiles/doc/erk\\_capi/index.html](https://easy-rob.com/fileadmin/Userfiles/doc/erk_capi/index.html)

CD-directory: [.Manual\API\ EASY-ROB Kernel.chm](#) or [.Manual\doxygen\\_ERK\\_CAPI\html\index.html](#)

Installation-directory:  
[.Manual\EASY-ROB Kernel.chm](#)

# EASY-ROB™

## 1 Your guide

### 1.5 EASY-ROB™ Remote Support

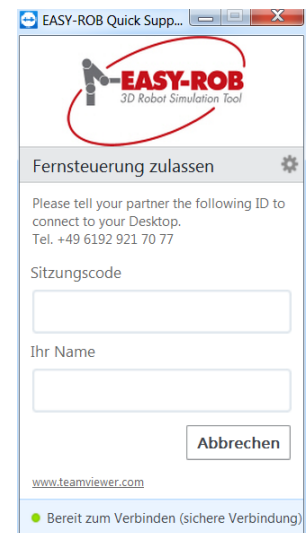

#### 1. Remote Support with TeamViewer

In order to support our customers much better, we provide you with the EASY-ROB™ TeamViewer Quick Support. A lot of problems can be solved much faster, by joining and watching either your or our EASY-ROB™ session.

Online: <https://easy-rob.com/en/contact/teamviewer/>

CD-directory: [.\TeamViewer\TeamViewerQSen.exe](#)

Installation-directory: [.\TeamViewer\TeamViewerQSen.exe](#)

# EASY-ROB™

Tutorial

## 2 Basics

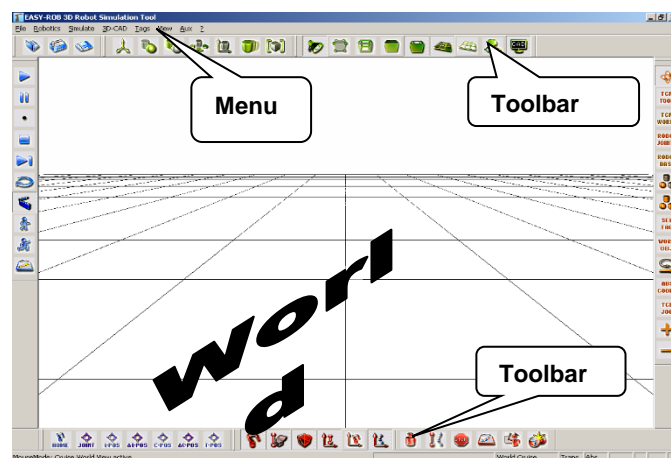

### 2.1 Terms

#### Target of the chapter:

Introduction of the terms and the environment in EASY-ROB™

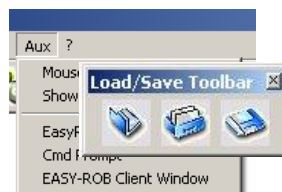

The screen consist of the following components:

- Menu
- Toolbars
- World

The **Menu** and **Toolbars** are providing different functions.

Toolbars can be placed everywhere in the world..

Cell file or Work cell (\*.cel)

The Work cell contains all into simulation involved devices (e.g. robots, tools, tables,...) and the programs.

Robot/Device file (\*.rob)

A robot file is device kinematics – e.g. a robot, a weld gun or a positioner.

Robot/Device Assembly file (\*.ras)

Robot assembly consisting of several robots/devices, that can be linked together.

Tool file (\*.tol)

A simple tool - TCP be set automatically

## Terms

Body file (*.bod)	A simple geometry without kinematics
Program file (*.prg, *.nc)	A program in EASY-ROB-language ERPL and ERCL for „Robot files“
Mimic file (*.mmc)	A Machine-Interface file, containing ERPL and ERCL commands
View file (*.vie)	File the store a position for a view, defined by the user
Camera file (*.cam)	A file to store the current camera settings like the focus
Tagpoint file (*.tag)	A file to store the tagpoints in a separate place

## System files

Environment file (easy-rob.env)	File to set the variables for the environment – such as background color, floor on/off, etc ....
Config file (config.dat)	System file: sets the location of the license.dat and paths for temporary and user files
License file (license.dat)	System file: contains your license information
Er_load (er_LoadFromLibPb_prefered.ini)	System file: contains preferred paths for the Device Manager
Working Pathes File (easy-rob.pth)	System file: sets paths for the working and geometry directories with "WORKDIR =" and "IGPDIR ="
Localization file (easy-rob-localizationx64.ini)	System file: sets the language of the GUI (English / German / Chinese)

# EASY-ROB™

Tutorial

## Basics

### 2.2 Mouse Navigation

#### Cruise, Zoom and moving the world

„Modify World view“ – activate by click

<b>Cruise Mode</b> (rotate / cruise the world):	<p>Press and hold Left Mouse Button (<b>LMB</b>) and move the cursor to the <b>left</b> respectively to the <b>right</b> -&gt; the world will rotate around Z-axis.</p> <p>Press and hold Left Mouse Button (<b>LMB</b>) and move the cursor <b>up</b> or <b>down</b> -&gt; the world will rotate around the X-axis</p>
<b>Zoom Mode</b>	<p>Press Middle Mouse Button (<b>MMB</b>) [or RMB if you are using a 2button mouse] and move the cursor to the <b>up-right</b> corner -&gt; Zoom-In,</p> <p>Press Middle Mouse Button (<b>MMB</b>) [or RMB if you are using a 2button mouse] and move the cursor to the <b>down-left</b> corner -&gt; Zoom-Out.</p>
<b>Pan Mode</b>	<p>Press Left und Right Mouse Button (LMR+RMB) at the same time and move the cursor -&gt; the whole world will move</p>

# EASY-ROB™

Tutorial

## 3 Setting up a work cell

### 3.1 Load and place existing components

#### Target of this chapter:

How to load and place an existing device from the library into the work cell.

#### Note:

Please read as well the Operation-References, topic *Kinematics Window* and *Frame Dialog*.

1.  
Load a robot into the world by using the button *Starte Device Manager*

Directory: ../EASY-ROB / TRAINlib / ...

Robot: AX-V6.rob

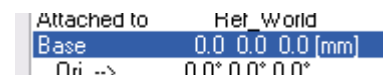

or shortcut „Ctrl+Shift+O“

2.  
Open the *Kinematics Window* by double click the button *Robot Base*

3.  
Double click the headword *Base* to open the *Frame Dialog*

4.  
Place the robot in X-direction -500  
by inserting the numbers

or

by buttons.

The “delta” you can adjust in the field „dist“.

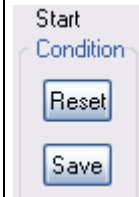

Robot Base Position

X  Rx

dist  dR

## Load and place existing components

<p>5. Confirm with OK.</p>	
<p>6. Save the new position as "Start Condition"</p>	 
<p>7. Save the work cell – use the button <i>Save Cell File</i> or shortcut</p> <p>Answer the question „Reset all Positions and Joints to Start Condition“ with Yes</p> <p>Save the work cell cell with the name <i>tutorial_01.cel</i> in the directory: ../EASY-ROB / TRAINlib /</p>	 <p>or shortcut „Ctrl+S“</p>
<p>8. Clear all by shortcut:</p> <p>Answer the question „Unload Cell“ with Yes</p>	<p>„Ctrl+U“</p>

# EASY-ROB™

Tutorial

## Setting up a work cell

### 3.2 Creating paths and tag points

#### Target of the chapter:

How to create a path with tag points and how to move along the path with different motion types.

#### Note:

Please read as well the Operation-References, topic *Tag Window*

1.  
Load the work cell *tutorial\_01.cel*  
by using the button *Start Device Manager*  
from directory: `../EASY-ROB / TRAINlib /`

or shortcut „Ctrl+Shift+O“

2.  
Save the work cell by using the button *Save Cell File*  
with the name *tutorial\_02.cel*  
in directory: `../EASY-ROB / TRAINlib /`

or shortcut „Ctrl+S“

3.  
Move the robot to home position by using the button *Home*

4.  
Open the *Tag Window* – click on button *Sel Tag*

5.  
Information:  
EASY-ROB always creates automatically one default path with the name *PATH01*. This path will be located in world zero and has to be assigned (or attached) to a device – e.g. the workpiece.

In this case we attach the path to robots base

Re-Attach the path *PATH01* to the robot base

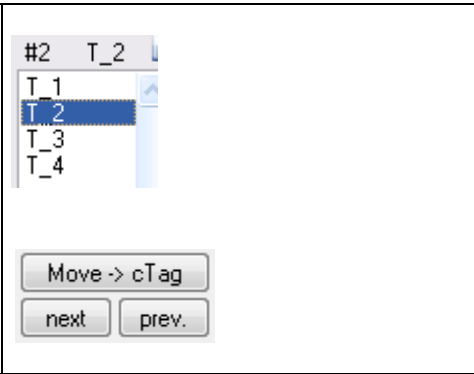

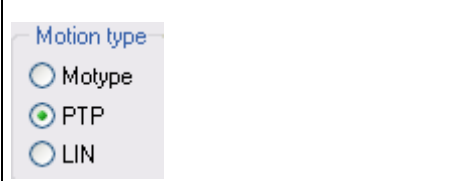

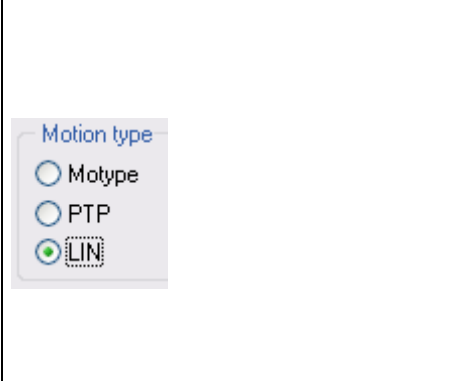

Attach cPath 'PATH01' to

- 1 - World
- 2 - cRobot 'AX-V6' Base
- 3 - cRobot 'AX-V6' Tip

## Creating paths and tag points

<p>Answer the question to “keep the world position” with <i>No</i></p>	
<p>6. Create a new tagpoint at the TCP of the robot with button <i>New TCP Tag</i></p> <p><u>Information:</u></p> <ul style="list-style-type: none"> <li>- the new point will get the default name T_1 (but you can change that)</li> <li>- the new tagpoint will be assigned automatically to the default path</li> <li>- and will be located on the TCP of the robot</li> </ul>	
<p>7. Double click on <i>Tag Position</i> to open the <i>Frame Dialog</i></p> <p>and move the tag point to Y= - 300 by inserting the coordinates</p> <p>or</p> <p>use the buttons.</p>	 
<p>8. Repeat step 6 and 7 for three more tag points and place them like in the table:</p> <p>TAG T_2 x = 810 y = 300 z = 1035</p> <p>TAG T_3 x = 810 y = 300 z = 800</p> <p>TAG T_4 x = 810 y = -300 z = 800</p>	

## Creating paths and tag points

<p>9. Double click onto the tag point name and the robot will move to the location</p> <p>or use buttons <i>next</i> und <i>prev.</i> to select the tagpoint and move by using the button <i>Move cTag</i></p>	
<p>10. Move to Tag T_1</p> <p>Switch on the TCP-Trace with button:</p> <p>Change the <i>Motion Type</i> to <i>PTP</i></p> <p>Move to every tag point - one after the other – and at the end move again to T_1</p> <p>Change the <i>Motion Type</i> to <i>LIN</i></p> <p>and move again to every tag point</p>	  
<p>11. To move along all tag points just hold „Shift“, select all tag points and use the “Move Along-button”</p> <p>Move the robot to home position by clicking on <i>HOME</i></p>	 
<p>12. Save the cell with the name <i>tutorial_02.cel</i> in directory: <i>../EASY-ROB / TRAINlib /</i> (Answer the question „Reset all Positions and Joints to Start Condition“ with <i>No</i>)</p>	

# EASY-ROB™

Tutorial

## Setting up a work cell

### 3.3 Creating a program

#### Target of the chapter:

How to create a program with all needed information like speed, motion type, etc.

#### Note:

Please read as well the Operation-References, topic *Teach Window*

1.  
Load the work cell *tutorial\_02.cel*  
by using the button *Start Device Manager*  
from directory: `../EASY-ROB / TRAINlib /`

or shortcut „Ctrl+Shift+O“

2.  
Save the cell with *Save Cell File*,  
name: *tutorial\_03.cel*  
in directory: `../EASY-ROB / TRAINlib /`

or shortcut „Ctrl+S“

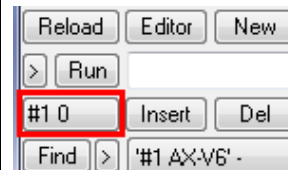

3.  
Open the *Teach Window* by clicking on the button *Open Program Teach Window*

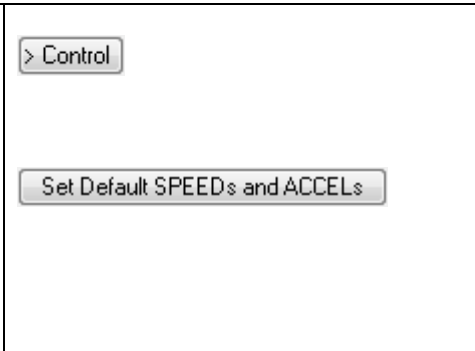

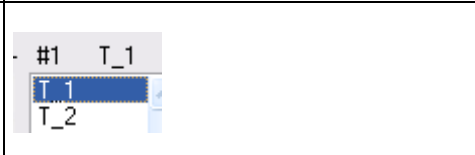

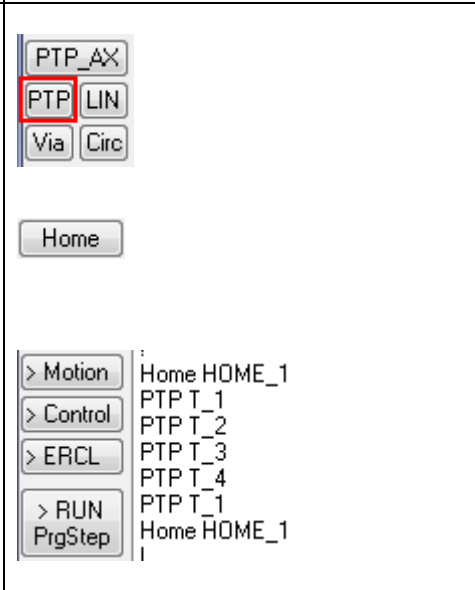

4.  
Create a new program with the button *New*  
  
and save the program with *Save as* and the suggested name  
„tutorial\_03-AX-V6.prg“  
in directory: `../EASY-ROB / TRAINlib /`  
  
answer the question to get the program loaded with *YES*

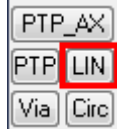

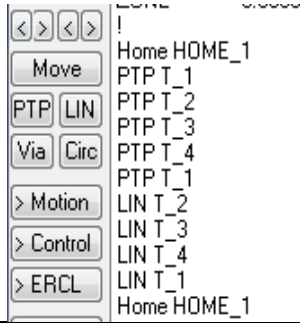

5.  
Open the program line window and set the cursor to line 10

## Creating a program

<p>6. Click &gt; <i>Control</i> to open the panel for setting <i>Control Commands</i></p> <p>set <i>Default SPEEDs and ACCELs</i> for speeds and acceleration</p> <p><b>Note:</b> To initialize the speed and acceleration it is very important to get correct results in a simulation.</p>	
<p>7. First insert the "<i>Home</i>"-Command to let the robot move to the home position.</p>	
<p>8. Open <i>Tag Window</i> by double click on the button <i>Sel Tag</i></p>	
<p>9. Select the first tag point T_1 from the list in the <i>Tag Window</i></p>	
<p>10. In the Teach Window click on PTP to insert the PTP-command into the program.</p> <p>Repeat step 9. and 10. for every tag point and at the end one more time for tag T_1</p> <p>Move the robot to the home position</p> <p>Now your program should look like this:</p>	
<p>11. Save the program with <i>Save</i></p> <p>and reload the program into the robot by clicking on <i>Reload</i></p>	

## Creating a program

<p>12. Start the simulation with the button <i>Run Program</i></p>	 or shortcut „Ctrl+R“
<p>13. Place the cursor after the second <i>Home1</i> command and extend the program like shown:</p> <p>Open the <i>Tag Window</i> with double click on button <i>Sel Tag</i></p> <p>Select the 2. tagpoint T_2 in the list <i>Tag Window</i></p>	
<p>14. Click on LIN in the <i>Teach Window</i> to insert the LIN-Command into the program.</p> <p>Repeat the step for every tag point and at the end one more time for tagpoint T_1</p> <p>Now your program should look like this :</p>	  
<p>15. Save the program with <i>Save</i></p> <p>and reload the program into the robot</p>	  
<p>16. Switch the trace on and start the simulation</p>	 
<p>17. Save the cell as <i>tutorial_03.cel</i></p> <p>in directory: <i>../EASY-ROB / TRAINlib /</i></p>	

# EASY-ROB™

## Setting up a work cell

Tutorial

### 3.4 Practice

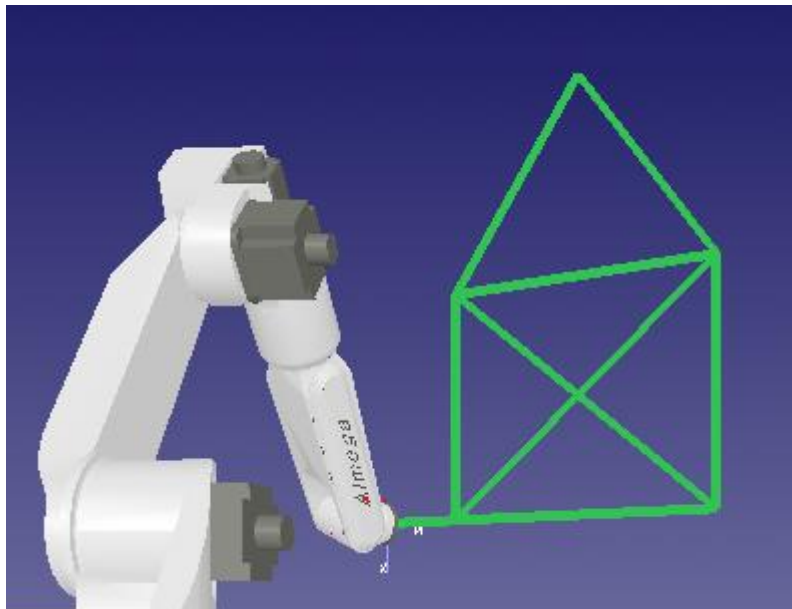

**Practice:**

Create a program that enables the robot to “draw with the trace” the figure shown below.

**Remark:**

It's not allowed to draw a line 2 times and not allowed to “jump” to another position.

It has to be done in one go.

# EASY-ROB™

Tutorial

## 4 Creating components

### 4.1 Creating simple geometry in EASY-ROB™

#### Target of the chapter:

How to create a simple geometry in EASY-ROB™.

#### Remark:

EASY-ROB™ is a tool to plan and simulate work cells with robots or other kinematics. It's not a 3D-CAD-System. Therefore EASY-ROB™ only provides functions to create simple geometries like cubes, cylinder, cones and spheres. More complex parts should be generated in a 3D-CAD-program and imported to EASY-ROB™ afterwards.

#### Note:

Please read as well the Operation-References, topic *3D-CAD Window*

1.  
Create a new device (Rob-file) :  
*Robotics | cRobot Kinematics | Create new Robot | Universal Coordinates (1-12 dof)*

Answer the question to create simple geometry with a click on *No*

2.  
Double click on the button *3D-CAD Window* to open the 3D-CAD Window

and select *Create Import* to get the creation dialog

Create Import

3.  
Create a cylinder with the numbers shown below

1	Radius	1.000000 <=	200.0000
2	Height 1	1.000000 <=	20.0000
3	y Scal	0.010000 <=	1.000000
4	Radius top	1.000000 <=	200.0000
5	Height 2	0.000000 <=	20.0000
6	y Scal top	0.010000 <=	1.000000

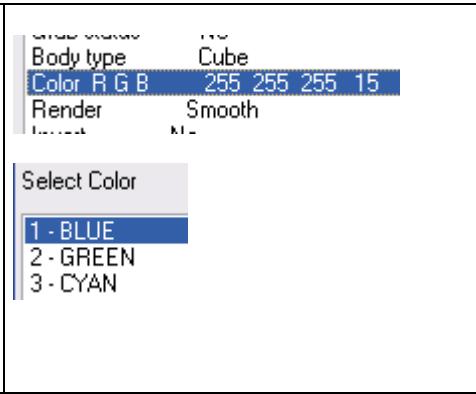

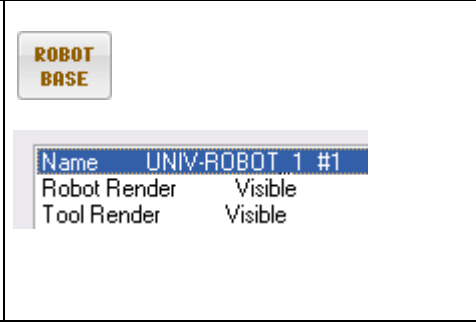

and save it with name: *r\_stat\_00*

2 - PYRAMID  
3 - WEDGE  
4 - CYLINDER  
5 - CONE

## Creating simple geometry in EASY-ROB™

<p>4. Create a second cylinder:</p> <table border="1"> <tr> <td>1</td> <td>Radius</td> <td>1.000000</td> <td>&lt;=</td> <td>50.0000</td> </tr> <tr> <td>2</td> <td>Height 1</td> <td>1.000000</td> <td>&lt;=</td> <td>500.0000</td> </tr> <tr> <td>3</td> <td>y Scal</td> <td>0.010000</td> <td>&lt;=</td> <td>1.000000</td> </tr> <tr> <td>4</td> <td>Radius top</td> <td>1.000000</td> <td>&lt;=</td> <td>50.0000</td> </tr> <tr> <td>5</td> <td>Height 2</td> <td>0.000000</td> <td>&lt;=</td> <td>500.0000</td> </tr> <tr> <td>6</td> <td>y Scal top</td> <td>0.010000</td> <td>&lt;=</td> <td>1.000000</td> </tr> </table> <p>and save it with the name: <i>r_stat_01</i></p>	1	Radius	1.000000	<=	50.0000	2	Height 1	1.000000	<=	500.0000	3	y Scal	0.010000	<=	1.000000	4	Radius top	1.000000	<=	50.0000	5	Height 2	0.000000	<=	500.0000	6	y Scal top	0.010000	<=	1.000000	<p>Create Import</p>
1	Radius	1.000000	<=	50.0000																											
2	Height 1	1.000000	<=	500.0000																											
3	y Scal	0.010000	<=	1.000000																											
4	Radius top	1.000000	<=	50.0000																											
5	Height 2	0.000000	<=	500.0000																											
6	y Scal top	0.010000	<=	1.000000																											
<p>5. Create a cube:</p> <table border="1"> <tr> <td>1</td> <td>X</td> <td>1.000000</td> <td>&lt;=</td> <td>200.0000</td> </tr> <tr> <td>2</td> <td>Y</td> <td>1.000000</td> <td>&lt;=</td> <td>200.0000</td> </tr> <tr> <td>3</td> <td>Height</td> <td>1.000000</td> <td>&lt;=</td> <td>150.0000</td> </tr> </table> <p>and save it with the name: <i>r_stat_02</i></p>	1	X	1.000000	<=	200.0000	2	Y	1.000000	<=	200.0000	3	Height	1.000000	<=	150.0000	<p>Create Import</p> <ul style="list-style-type: none"> <li>1 - CUBE</li> <li>2 - PYRAMID</li> <li>3 - WEDGE</li> </ul>															
1	X	1.000000	<=	200.0000																											
2	Y	1.000000	<=	200.0000																											
3	Height	1.000000	<=	150.0000																											
<p>6. Change the position of the cube:</p>	<p>Offset Position</p> <p>X -100.000</p> <p>Y -100.000</p> <p>Z 500.000</p>																														
<p>7. Save the current position of all bodies with Save</p> <p><i>all Body positions</i></p>	<p>Save</p> <ul style="list-style-type: none"> <li>1 - cBody positions</li> <li>2 - all Body positions</li> <li>3 - Quit</li> </ul>																														

## Creating simple geometry in EASY-ROB™

<p>8. Change the color of the cube: double click on <i>Color RGB</i> in the properties in the 3D-CAD Window</p> <p>select 1- <i>BLUE</i></p> <p>Answer the question "Copy color for whole robot" with <i>No</i></p>	
<p>9. Double click the button <i>Robot Base</i> to open the Kinematics Window</p> <p>Double click on <i>Name</i> to open the String Dialog</p> <p>and rename the DEVICE to „<i>cleaningstation</i>“</p>	
<p>10. Save the DEVICE with a click on <i>Save</i> in Kinematics Window</p> <p>accept the suggested name</p> <p>and save the DEVICE under the name <i>CLEANINGSTATION.rob</i></p> <p>in directory: ../EASY-ROB / TRAINlib /</p>	
<p>11. Clear the work cell :</p> <p>Answer the question „Unload Cell“ with <i>Yes</i></p> <p>Save cell: <i>No</i></p>	<p>„Ctrl+U“</p>

# EASY-ROB™

## Creating components

Tutorial

### 4.2 Import geometry from VRML

#### Target of the chapter:

How to import 3D-CAD geometry from VRML.

The imported VRML files will be stored in EASY-ROB™ as IGP-Format (\*.igp). The importer creates automatically a \*.rob-file besides the \*.igp-file.

#### Note:

Please read as well the Operation-References, topic *CAD Import - VRML*

1.  
Select Menu :  
*File | Load | Import / Convert | Convert VRML 1.0 / 2.0 into CAD Preview*

or use Drag & Drop to import the file *workpiece\_panel.wrl*

from directory: *../EASY-ROB / TRAINlib / igp*

2.  
Save the file *workpiece\_panel.igp*

in the directory: *../EASY-ROB / TRAINlib / igp*

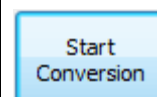

3.  
Don't change the default settings and start the conversion.

Answer the question to load the file with Yes to view the result.

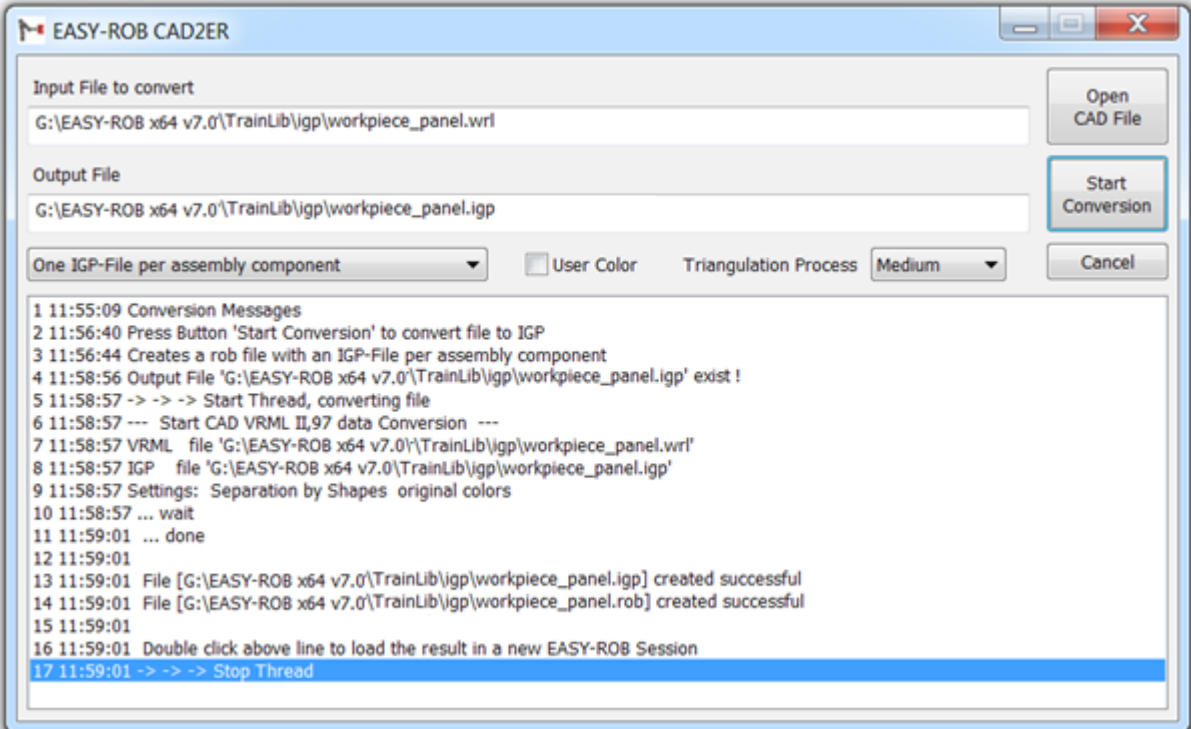

Answer the question if the "file" should be "merged" with Yes

Answer the question if the "lines" should be "skipped" with Yes

The importer saves automatically the \*.ROB- and the \*.IGP-file.

## Creating components

<p>4. Switch to Windows Explorer and open the directory ../EASY-ROB / TRAINlib / igp  now move the created *.ROB-file one directory up.</p>	
<p><b>Remark:</b> <b>Import of other CAD formats from other CAD Systems</b></p> <p>EASY-ROB™ uses the 3D_Evolution® API of CT Core Technology GmbH to import CAD data. The CT Kernel_IO was especially designed for CAD data import and allows importing and optimizing CAD data formats generated by different CAD-Systems.</p> <p>Please read the chapter <i>CAD Import – CT Kernel_IO</i> in the Operation References.</p>	
<p>Start CAD2ER as x86 Version ..\\cad2er\\Cad2ErExe.exe</p> <ol style="list-style-type: none"> <li>1. Select file "workpiece_panel.wrl"</li> <li>2. Choose from list "One IGP-File per assembly component"</li> <li>3. Choose "Start Conversion" to create "workpiece_panel.igp" and "workpiece_panel.rob".</li> </ol>	
	

# EASY-ROB™

Tutorial

## 5 Extend a work cell

### 5.1 Add components

#### Target of the chapter:

How to load and place additional DEVICES like a welding gun, a cleaning station, a positioner and workpiece.

#### Note:

Please read as well the Operation-References, topic *Kinematics Window* und *Frame Dialog*.

1.  
Load the work cell *tutorial\_03.cel*  
*Start Device Manager*  
from directory: `../EASY-ROB / TRAINlib /`

or shortcut „Ctrl+Shift+O“

2.  
Save the cell with *Save Cell File*  
name it: *tutorial\_04.cel*  
in directory: `../EASY-ROB / TRAINlib /`

or shortcut „Ctrl+S“

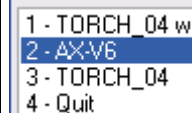

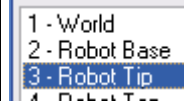

3.  
Double click on *Robot Base* to open the Kinematics Window

Load the welding gun *torch\_04.rob*  
from directory: `../EASY-ROB / TRAINlib /`

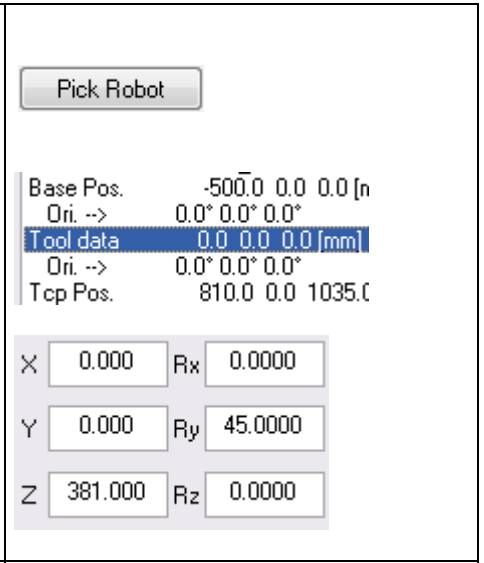

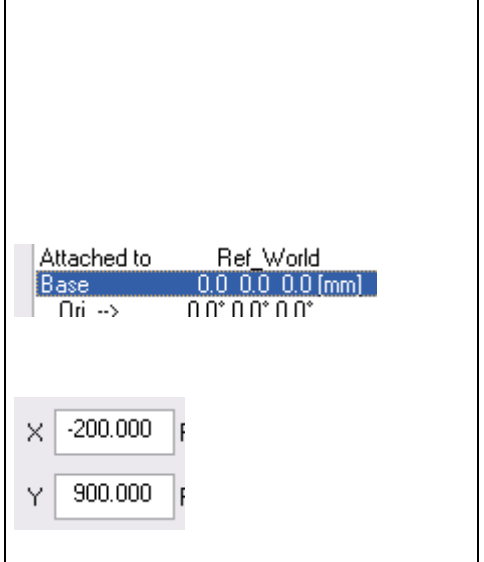

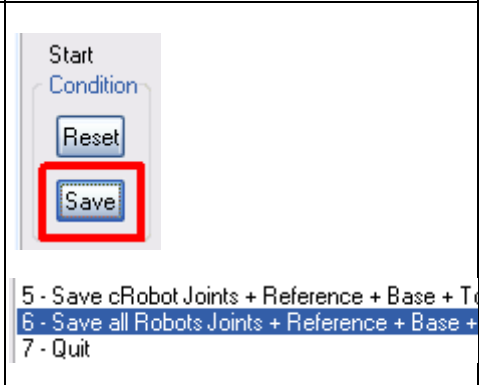

4.  
Re-attach the gun with *Re-Attach* at robot tip

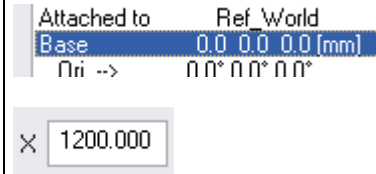

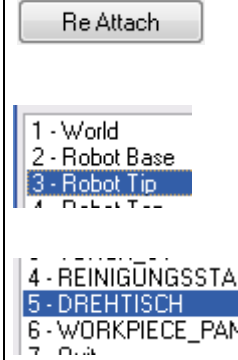

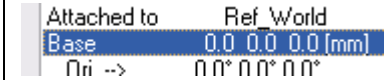

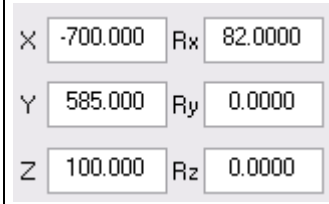

Answer the question with *No* to keep the position

## Add components

<p>5. Click <i>Pick Robot</i> and select the robot by a mouse click</p> <p>Open the Frame Dialog by a mouse click on <i>Tool</i> in the properties to set a new tool</p> <p>Set the following values to:</p>	
<p>6. Load the cleaning station <i>cleaningstation.rob</i> (that one you created and saved in the previous chapter)</p> <p>from directory: <code>../EASY-ROB / TRAINlib /</code></p> <p>Place the cleaning station by using the Frame Dialog (open the dialog by mouse click <i>Base</i>)</p> <p>Set the following values:</p>	
<p>7. Save the current position of all existing devices by using "Save Start Condition"</p>	 <p>5 - Save cRobot Joints + Reference + Base + Tool 6 - Save all Robots Joints + Reference + Base + Tool 7 - Quit</p>

## Add components

<p>8. Load the positioner <i>drehtisch.rob</i></p> <p>from directory: ../EASY-ROB / TRAINlib /</p> <p>Open the Frame Dialog (double click on Base) to place the positioner</p> <p>Set the following value:</p>	
<p>9. Load with button <i>Load</i> the workpiece <i>workpiece_panel.rob</i></p> <p>from directory: ../EASY-ROB / TRAINlib /</p>	
<p>10. Attach the workpiece with button <i>Re-Attach</i> to the positioner tip</p> <p>Don't keep the position in the world</p> <p>Place the workpiece with Frame Dialog</p> <p>Set the following values:</p>	  

## Add components

11.

Save cell with *Save Cell File*

name it *tutorial\_04.cel*

in the directory: ../EASY-ROB / TRAINlib /

**IMPORTANT:**

Question to "Reset all Positions and Joints to Start Condition" : *No*

Save position as start position: *Yes*

or shortcut „Ctrl+S“

# EASY-ROB™

Tutorial

## Extend a work cell

### 5.2 Creating paths and tag points at devices

#### Target of the chapter:

How to create paths and tag points at the workpiece.

#### Note:

Please read as well the Operation-References, topic *Tag Window und Kinematics Window*

1.  
Load the cell *tutorial\_04.cel*  
*Start Device Manager*  
from directory: *../EASY-ROB / TRAINlib /*

or shortcut „Ctrl+Shift+O“

2.  
Move the robot to home position by clicking on *Home*

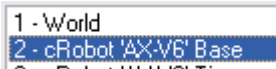

3.  
Open the *Tag Window* (double click on *Sel Tag*)

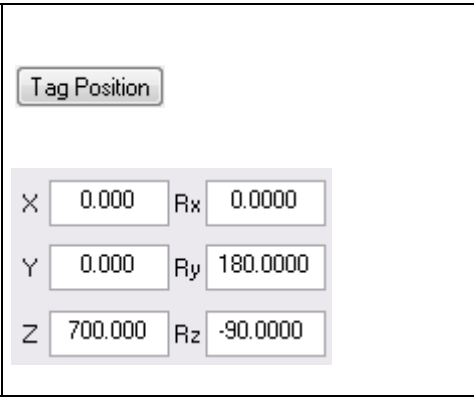

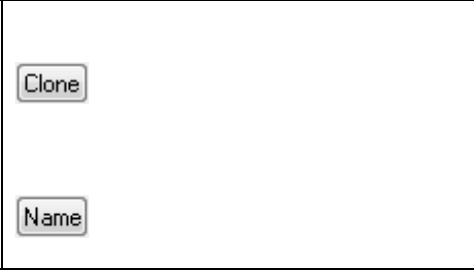

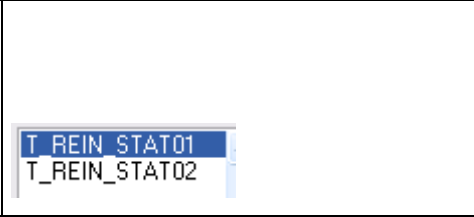

Delete all existing paths by clicking on *Delete*

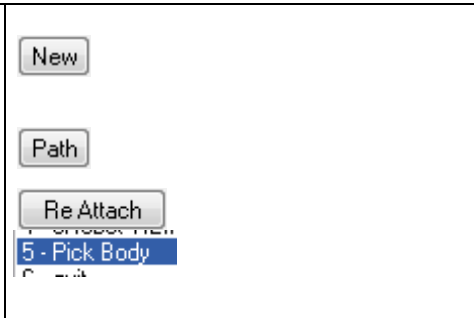

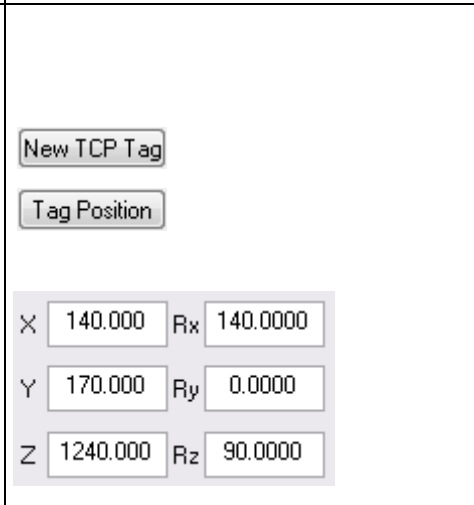

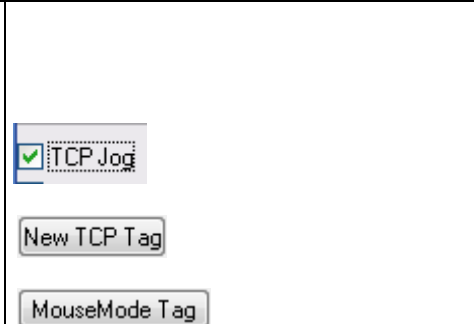

## Creating paths and tag points at devices

<p>4. Save cell with <i>Save Cell File</i> name it: <i>tutorial_05.cel</i> in directory: <i>../EASY-ROB / TRAINlib /</i></p>	 or shortcut „Ctrl+S“
<p>5. Open the Kinematics Window (double click on <i>Robot Base</i>)  Select robot (<i>Pick Robot</i>)  Open Joint Values and set the following values Axis 2 = -30 Grad Axis 5 = 60 Grad</p>	  
<p>6. Rename the path <i>PATH01</i> to <i>start_pos</i> in the <i>Tag Window</i>  Re-Attach the part <i>start_pos</i> robots base  Keep position: <i>No</i></p>	    
<p>7. Create a new tag point with <i>New TCP Tag</i>  Rename the tag point to <i>T_start_pos</i></p>	  
<p>8. Create a new path with <i>New</i>  Rename the <i>PATH02</i> to <i>clean_stat</i>  Re-Attach the path <i>clean_stat</i> by using the option <i>Pick Body</i> to the base of cleaning station  Keep position: <i>No</i>  Create a new tag point (<i>New TCP Tag</i>)  Rename the tag point to <i>T_clean_stat01</i></p>	          

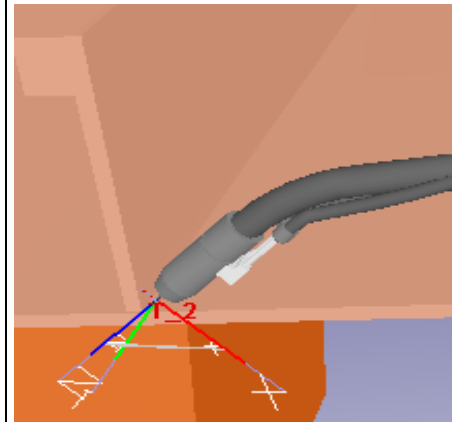

## Creating paths and tagpoints at devices

<p>9. Open the <i>Frame Dialog</i> by clicking on <i>Tag Position</i></p> <p>and shift the tag point to the position:</p>	 <p>Tag Position</p> <p>X 0.000 Rx 0.0000</p> <p>Y 0.000 Ry 180.0000</p> <p>Z 700.000 Rz -90.0000</p>
<p>10. Clone the tag point <i>T_clean_stat01</i></p> <p>and place the new tag point in <i>z = 600</i></p> <p>Rename the tag point to <i>T_clean_stat02</i></p>	 <p>Clone</p> <p>Name</p>
<p>11. Select the robot with <i>Pick Robot</i> in Kinematics Window</p> <p>and move to the tag points by double click onto the tag point's name</p>	 <p>T_REIN_STAT01</p> <p>T_REIN_STAT02</p>
<p>12. Change the path and move to start position by double click onto the tag point <i>T_start_pos</i></p>	 <p>T_START_POS</p>
<p>13. Save cell and name it <i>tutorial_05.cel</i></p> <p>in the directory: <i>../EASY-ROB / TRAINlib /</i></p>	
<p>14. Select the positioner "drehtisch" with <i>Pick Robot</i> in the Kinematics Window</p> <p>Open the Joint Values and set them to:</p> <p>Axis 1 = -90 Grad</p>	 <p>JOINT</p>

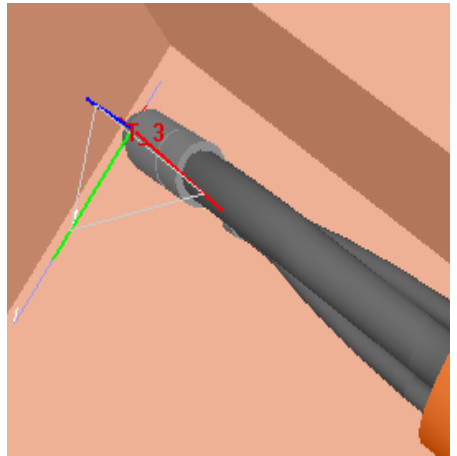

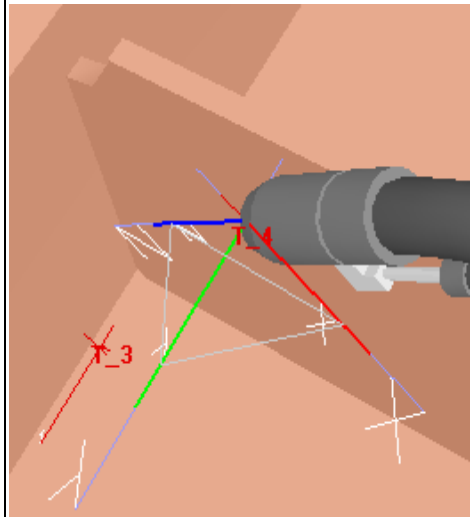

## Creating paths and tagpoints at devices

<p>15. Create a new path in Tag Window</p> <p>Rename the path <i>PATH03</i> to <i>seam</i></p> <p>Re-Attach the path <i>seam</i> with option <i>Pick Body</i> to the workpiece</p> <p>Keep position: <i>No</i></p>	
<p>16. Select the robot (<i>Pick Robot Kinematics Window</i>)</p> <p>Create a new tag point with <i>New TCP Tag</i></p> <p>Open the <i>Frame Dialog</i> by click on <i>Position</i></p> <p>and shift the tag point to:</p>	
<p>17. Move the tag point</p> <p>switch <i>TCP Jog</i> on</p> <p>Create a new tag point ( <i>New TCP Tag</i> )</p> <p>Select <i>MouseMode Tag</i></p>	

and shift the tag point with your mouse by moving it to the start position of the welding seam.

## Creating paths and tagpoints at devices

<p>18. Create a new tag point (<i>New TCP Tag</i>)</p> <p>Select <i>MouseMode Tag</i></p> <p>and shift the tag point with your mouse by moving it to the end of the welding seam.</p>	<div data-bbox="986 392 1139 430">New TCP Tag</div> <div data-bbox="986 495 1177 533">MouseMode Tag</div> 
<p>19. Create a new tag point with <i>New TCP Tag</i></p> <p>Select <i>MouseMode Tag</i></p> <p>and shift the tag point with your mouse by moving it away from the "welding seam".</p>	<div data-bbox="986 1108 1139 1146">New TCP Tag</div> <div data-bbox="986 1187 1177 1225">MouseMode Tag</div> 

## Creating paths and tagpoints at devices

20. Move along all tag points	
21. Move robot to start position	
22. Select the positioner "drehtisch" with <i>Pick Robot</i> in Kinematics Window  move the positioner to home position	
23. Save cell as <i>tutorial_05.cel</i>  in the directory: ../EASY-ROB / TRAINlib /  Reset all positions: <i>No</i>  Save current positions as start positions: <i>Yes</i>

## Extend a work cell

### 5.3 Creating a program (welding simulation)

#### Target of the chapter:

How to create a program to simulate welding

#### Note:

Please read as well the Operation-References, topic *Teach Window*

1.  
Load cell *tutorial\_05.cel*  
Start Device Manager  
from directory: ../EASY-ROB / TRAINlib /

or shortcut „Ctrl+Shift+O“

2.  
Save cell (Save Cell File)  
name it *tutorial\_06.cel*  
in directory: ../EASY-ROB / TRAINlib /

or shortcut „Ctrl+S“

3.  
Select the robot (*Pick Robot*) in Kinematics Window

4.  
Open the *Teach Window* by a mouse click on the Button *Open Program Teach Window*

5.  
Create a new program (*New*)  
  
and save the program with the suggested name „tutorial\_06-AX-V6.prg“  
in the directory: ../EASY-ROB / TRAINlib /

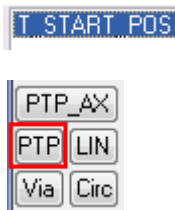

Reload the program : Yes

6.  
Open the program line window and set the cursor to line 10

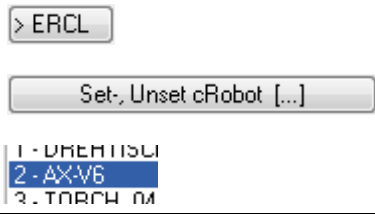

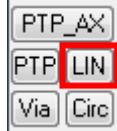

## Creating a program (welding simulation)

<p>7. Click &gt; <i>Control</i> to open the panel to set <i>Control Commands</i></p> <p>and set Default SPEEDs and ACCELs</p>	
<p>8. Move the robot to home position</p>	
<p>9. Open <i>Tag Window</i> (double click <i>Sel Tag</i>)</p>	
<p>10. Select the tag point T_START_POS from path START_POS</p> <p>click on PTP in Teach Window to insert the tagpoint with command</p>	
<p>11. Select the tag point T_REIN_STAT01 from path REIN_STAT</p> <p>click on PTP in Teach Window to insert the tag point with command</p>	
<p>12. Select the tag point T_REIN_STAT02 from path REIN_STAT</p> <p>click on PTP in Teach Window to insert the tag point with command</p>	
<p>13. Select the tag point T_REIN_STAT01 from path REIN_STAT</p> <p>click on PTP in Teach Window to insert the tag point with command</p>	

## Creating a program (welding simulation)

<p>14. Save the program (<i>Save</i>)</p> <p>and reload the program into the robot</p>	 
<p>15. Run the simulation (<i>Run Program</i>)</p>	 or shortcut „Ctrl+R“
<p>16. Set the cursor after the last <i>PTP</i>- command and continue programming:</p>	
<p>17. Deactivate the robot: click on <i>&gt;ERCL</i> , then <i>Set., Unset cRobot</i></p> <p>and select <i>UNSET</i></p>	  
<p>18. Activate the positioner: click <i>&gt;ERCL</i> , then <i>Set., Unset cRobot</i></p> <p>and select <i>SET</i> (select the positioner “DREHTISCH”)</p> <p>open the Joint Values und set axis 1 = -90 Grad</p> <p>click <i>&gt; Motion</i>,</p> <p>click <i>PTP AX</i> (to insert axis value into the program)</p>	       
<p>19. Deactivate the positioner: click <i>&gt;ERCL</i> , then <i>Set., Unset cRobot</i></p> <p>and select <i>UNSET</i></p>	  

## Creating a program (welding simulation)

<p>20. Activate the robot: click <i>ERC</i> , then <i>Set., Unset cRobot</i> and select <i>SET</i> (select the robot)</p>	
<p>21. Select the tagpoint <i>T_1</i> from path <i>SEAM</i> in Tag Window  click on <i>LIN</i> in the Teach Window to insert the tagpoint with the command  Repeat this step for every tagpoint from path <i>SEAM</i></p>	
<p>22. Select the tagpoint <i>T_START_POS</i> from path <i>START_POS</i>  click on <i>PTP</i> in the Teach Window to insert the tagpoint with the command</p>	
<p>23. Deactivate the robot: click <i>ERC</i> , then <i>Set., Unset cRobot</i> and select <i>UNSET</i>  Activate the positioner: click <i>ERC</i> , then <i>Set., Unset cRobot</i> and select <i>SET</i> (select "drehtisch")  open Joint Values and set axis 1 = 0 deg Select <i>Motion</i>, click <i>PTP AX</i> (to insert the axis value)  Deactivate the positioner: click <i>ERC</i> , then <i>Set., Unset cRobot</i> and select <i>UNSET</i>  Activate the robot : click <i>ERC</i> , then <i>Set., Unset cRobot</i> and select <i>SET</i> (select the robot)</p>	
<p>24. Add the <i>Home</i>-command to the program</p>	

## Creating a program (welding simulation)

<p>25. Save the program (Save)</p> <p>and reload the program into the robot</p>	 
<p>26. Save the work cell as <i>tutorial_06.cel</i></p> <p>in the directory: ../EASY-ROB / TRAINlib /</p>	
<p>27. Run the simulation</p>	
<p>28. Switch collisions control ON</p> <p>and run the simulation again, to check for collisions.</p> <p>In case of collisions modify your path.</p>	 

# EASY-ROB™

## Extend a work cell

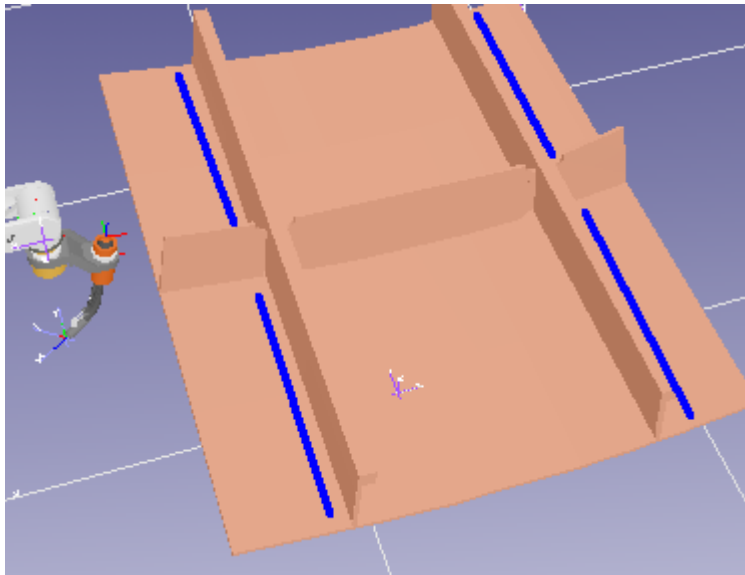

Tutorial

### 5.4 Practice

**Practice:**

Extend the program of the welding simulation and weld all 4 outer seams.

Create all tag points and make sure that the program runs without any collision.

## 6 Setup kinematics

### 6.1 Creating a positioner with simple kinematics

#### Target of the chapter:

Creating a simple kinematics for a positioner with standard CAD components. All required properties like travel limits or home position will be set.

#### Note:

Please read as well the Operation-References, topic *Kinematics Window*

1.  
Create a new device (Rob-file) :  
*Robotics | cRobot Kinematics | Create new Robot | Universal Coordinates (1-12 dof)*

Answer for creating simple geometry: *No*

2.  
Open kinematics Window (double click on *Robot Base*)

ROBOT  
BASE

3.  
Open the String Dialog (double click on *Name*) and change the name of the device to „tutorial\_positioner“

Name UNIV-ROBOT\_1 #1

4.  
Open the Selection Dialog to change the kinematics properties: click on *Kinematics*

and set the number of active joints

in this case leave the default setting to 1

Set the direction for the axis: click on *active Jnt* and press *OK*

select rotation around *Z*

Kinematics

1 - Active Joints

1 - Number active Joints ( 1 )

1.000000 <= 1.000000 <= 12.0000

1 - Number active Joints

2 - active Jnt 1 RZ

3 - RZ

5 - RUI Y

6 - RQT Z

7 - RZ

## Creating a positioner with simple kinematics

in Frame Dialog set the position of the joint  $z=700$

confirm with OK and close the dialog

X	0.000
Y	0.000
Z	700.000

5.

Open the 3D-CAD Window (double click *3D-CAD Window*)

and select *Create Import* to get the Selection Dialog to create basic geometries

Create a cylinder

like shown in the table:

Create Import

2 - PYRAMID  
3 - WEDGE  
4 - CYLINDER  
5 - CONE

1	Radius	1.000000	<=	200.0000
2	Height 1	1.000000	<=	700.0000
3	y Scal	0.010000	<=	1.000000
4	Radius top	1.000000	<=	200.0000
5	Height 2	0.000000	<=	700.0000
6	y Scal top	0.010000	<=	1.000000

and save the part with the name *tut\_positioner\_00*

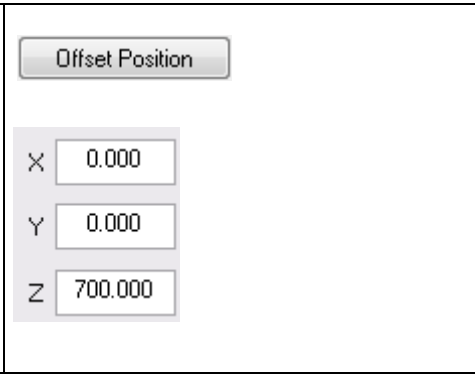

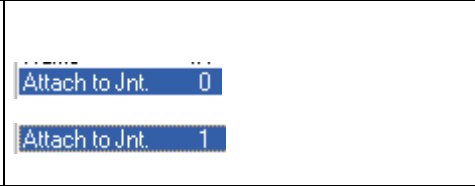

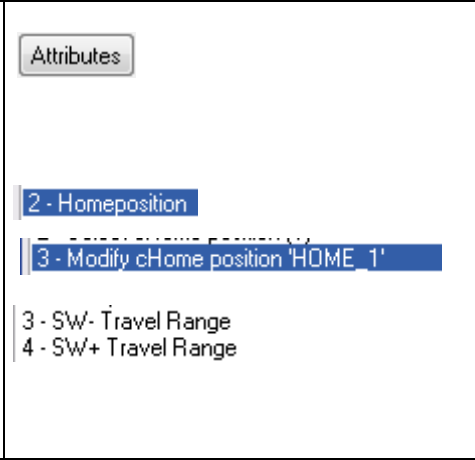

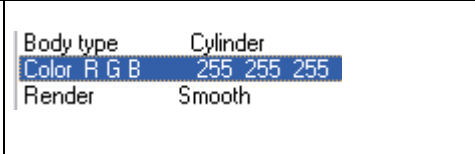

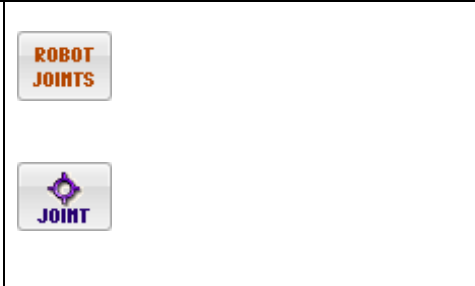

6.

Create a second cylinder like shown below:

1	Radius	1.000000	<=	500.0000
2	Height 1	1.000000	<=	50.0000
3	y Scal	0.010000	<=	1.000000
4	Radius top	1.000000	<=	500.0000
5	Height 2	0.000000	<=	50.0000
6	y Scal top	0.010000	<=	1.000000

and save the part with the name *tut\_positioner\_01*

## Creating a positioner with simple kinematics

<p>7. Change the position of the part <i>tut_positioner_01</i> with <i>Offset Position</i> to <i>Z=700</i></p>	 <p>Offset Position</p> <p>X 0.000</p> <p>Y 0.000</p> <p>Z 700.000</p>
<p>8. Select <i>Attach to Jnt</i> in the properties of the part <i>tut_positioner_01</i> and attach the part to Joint 1</p>	 <p>Attach to Jnt. 0</p> <p>Attach to Jnt. 1</p>
<p>9. Open the attributes of the positioner with a click on <i>Attribute</i> in the <i>Kinematics Window</i></p> <p>Select <i>Homeposition</i> then select „<i>Modify cHome position ,Home1</i>“ and confirm the question to save the current position as Home Position with Yes</p> <p>change the travel limits to -360 and +360 degree</p> <p>close the dialog</p>	 <p>Attributes</p> <p>2 - Homeposition</p> <p>3 - Modify cHome position 'HOME_1'</p> <p>3 - SW- Travel Range</p> <p>4 - SW+ Travel Range</p>
<p>10. Change the color of the base <i>tut_positioner_00</i> in the 3D-CAD Window to grey</p>	 <p>Body type Cylinder</p> <p>Color R G B 255 255 255</p> <p>Render Smooth</p>
<p>11. Save the positioner (Save) – confirm the suggested name</p>	 <p>Save</p>
<p>12. Select <i>Robot Joints</i> and move the mouse (hold LMB down)</p> <p>or set axis values in <i>Joint</i></p> <p>to rotate the table.</p>	 <p>ROBOT JOINTS</p> <p>JOINT</p>

## 7 Creating a Multi-Robot Work cell

### 7.1 Creating the programs

#### Target of the chapter:

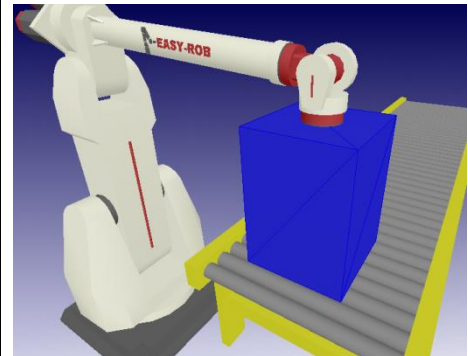

To build up a simulation with two communicating devices (each one has a single program) by using digital signals. It is a robot and a conveyor.

The robot will place the workpiece (blue box) onto the conveyor, which will move the workpiece forward and backward. At the origin the robot will take the workpiece and put it back to the starting place.

An existing work cell load from the library will be used for this exercise.

#### Note:

**The option „Multi-Robot“ is required for this exercise!**

1. Load the work cell *tutorial\_multi\_program\_01.cel* by using the button *Start Device Manager*

from directory: `../EASY-ROB / TRAINlib /`

or shortcut „Ctrl+Shift+O“

2. Save the work cell by using the button *Save Cell File* with the name *tutorial\_multi\_program\_02.cel* in: `../EASY-ROB / TRAINlib /`

or shortcut „Ctrl+S“

3. Select the robot (pick robot) and open the *Teach Window* by a mouse click on the button *Open Program Teach Window*

4. Create a new program by using the button *New*

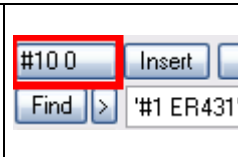

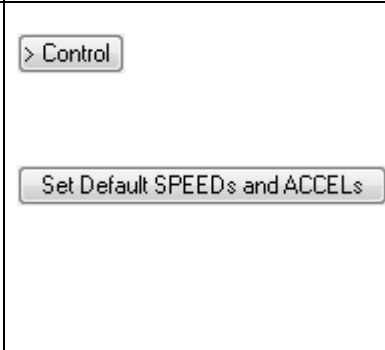

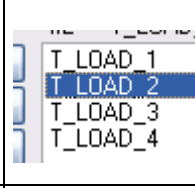

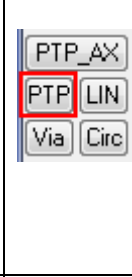

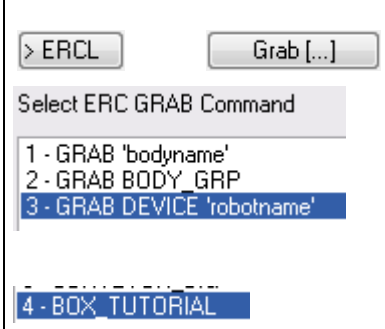

and save the program with *Save as* under the suggested name „tutorial\_multi\_program\_01-ER431.prg“ in the directory: `../EASY-ROB / TRAINlib /`

Answer the following question (reload the program) with “Yes”.

New

Save as

## Creating the programs

<p>5. Open the line number window and set the cursor to line 10</p>	
<p>6. Open the panel for the <i>Control Commands</i> by using the button &gt; <i>Control</i> and set the standard speeds and accelerations by using the button “Set Default SPEEDs and ACCELs”</p> <p><b>Remark:</b> This step is very important – the initialization of the speeds and accelerations is the base for proper simulation results.</p>	
<p>7. At the beginning the robot has to be moved to the Home position Add the <i>Home</i> command to the program by using the button <i>Home</i></p>	
<p>8. Open the <i>Tag Window</i> by double click on the button <i>Sel Tag</i></p>	
<p>9. Select the tag point T_LOAD_2 from the path LOAD_WP by <b>double click</b>, to make sure that the robot is moving to the tag point.</p>	
<p>10. Click on PTP in the Teach Window to add the tag point with a PTP-command to the program</p> <p>Repeat the Step 9. and 10. for the tag point:  T_LOAD_1</p>	
<p>11. Let the robot grab the workpiece:</p> <p>and select the workpiece</p>	

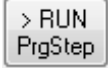

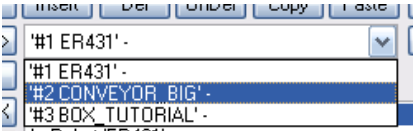

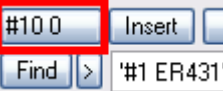

## Creating the programs

<p>12. Select the tag point T_LOAD_2 from the path LOAD_WP <b>by double click</b>, to make sure that the robot is moving to the tag point.</p>	
<p>13. Click on PTP in the Teach Window to add the tag point with a PTP-command to the program Repeat the Step 9. and 10. for the tag point:</p> <p style="padding-left: 40px;">T_LOAD_3 T_LOAD_4</p> <p>(the workpiece should be on the conveyor now)</p>	
<p>14. Now the robot has to release the workpiece:</p> <p>Select the workpiece</p>	<div style="border: 1px solid gray; padding: 5px;"> <div style="display: flex; justify-content: space-between; margin-bottom: 5px;"> <span>&gt; ERCL</span> <span>Release [...]</span> </div> <div style="border: 1px solid gray; padding: 2px; margin-bottom: 5px;">Select ERC RELEASE Command</div> <div style="margin-bottom: 5px;"> 1 - RELEASE 'bodyname'  2 - RELEASE BODY_GRP  3 - RELEASE DEVICE 'robotname' </div> <div> 4 - BOX_TUTORIAL </div> </div>
<p>15. Select the tag point T_BOX_TOP_2 from the path BOX_TOP <b>by double click</b>, to make sure that the robot is moving to the tag point.</p>	
<p>16. Click on PTP in the Teach Window to add the tag point with a PTP-command to the program</p>	
<p>17. Save the program with <b>Save</b></p> <p>(Reset all Positions and Joints to Start condition : Yes)</p>	<div style="border: 1px solid gray; padding: 5px; width: fit-content; margin: auto;">Save</div>
<p><b>Remark:</b> Now the robot is done for the first part and it is the turn of the conveyor. But we continue programming the second part for the robot and we will do later on the program for the conveyor.</p>	

## Creating the programs

18. Add the comment to the current line of the program: (important: don't forget the exclamation mark)	! Position for signal
19. Select the tag point T_BOX_TOP_1 from the path BOX_TOP <b>by double click</b>	
20. Click on PTP in the Teach Window to add the tag point with a PTP-command to the program.	
21. Let the robot grab the workpiece.	
22. Select the tag point T_LOAD_3 from the path LOAD_WP <b>by double click</b>	
23. Click on PTP in the Teach Window to add the tag point with a PTP-command to the program  Repeat step 9. and 10. for tag point: T_LOAD_2 T_LOAD_1  (the work piece should be on the floor again)	
24. Now the robot has to release the work piece again.	
25. Select the tagpoint T_BOX_TOP_2 from the path BOX_TOP and add the tag point by click onto PTP into the program.	
26. Drive robot „HOME“ (add the <i>Home</i> command to the program).	

## Creating the programs

27. Save the program with Save	
28. Save the work cell with the name <i>tutorial_multi_program_02.cel</i> in the directory: ../EASY-ROB / TRAINlib /	
29. Start the simulation	
<b>Remark:</b> Now we have to create the program for the conveyor and therefore the workpiece should be placed onto the conveyor.  Run the robot program in single step mode, until the workpiece is placed onto the conveyor.  Unload the robot program!	 
30. Select the conveyor in the Pull Down Menu from the Teach Window	
31. Create a new program by using the button <i>New</i>  and save the program with <i>Save as</i> under the suggested name „tutorial_multi_program_01-CONVEYOR_BIG.prg“ in directory: ../EASY-ROB / TRAINlib /  answer the following question (reloading the program) with Yes	 
32. Open the line number window and set the cursor to line 10	

## Creating the programs

<p>33. Open the panel for the <i>Control Commands</i> by clicking on <i>&gt;Control</i></p> <p>and set the standard speeds and accelerations by using the button “Set Default SPEEDs and ACCELs”</p>	  
<p>34. Insert the command Home into the program by using the button <i>Home</i></p>	
<p>35. Now the conveyor has to grab the workpiece: (like the robot earlier)</p>	  
<p>36. Select the tag point T_CONV_2 from the path CONV <b>by double click</b>, to make sure that the conveyor is moving to the point.</p>	
<p>37. Click on PTP in the Teach Window to add the tag point with a PTP-command to the program Repeat the Step 36. and 37. for the tagpoint: T_CONV_1</p>	
<p>38. The conveyor has to release the workpiece:</p>	  
<p>39. Save the program with <i>Save</i></p>	
<p>40. Save the work cell with the name <i>tutorial_multi_program_02.cel</i>  in the directory: <i>../EASY-ROB / TRAINlib /</i></p>	

# EASY-ROB™

Tutorial

## Creating a Multi-Robot Work cell

### 7.2 Connecting the programs with signals

#### Target of the chapter:

To connect the created programs from previous chapter by using digital signals.

**Note: The option „Multi-Robot“ is required for this exercise!**

1.  
Load the work cell *tutorial\_multi\_program\_02.cel*  
by using the button *Start Device Manager*  
from the directory: *../EASY-ROB / TRAINlib /*

or shortcut „Ctrl+Shift+O“

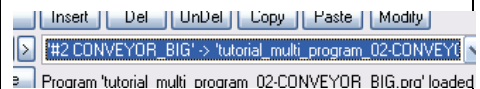

2.  
Select both devices by the Pull Down Menu in the Teach Window  
and check if the programs are loaded.  
  
If the programs are not loaded, load them by using „LOAD“

3.  
Save the work cell with the name *tutorial\_multi\_program\_03.cel*  
in the directory: *../EASY-ROB / TRAINlib /*

4.  
Select first the conveyor by using the Pull Down Menu from the  
Teach Window

5.  
To initialize the outgoing signal of the conveyor, set the cursor in the  
Teach Window to line 5 (before of the “EndInit“-command) and add  
the command:

conv\_out=0

## Connecting the programs

<p>6. Place the cursor onto the command „ERC GRAB DEVICE BOX_TUTORIAL“ and add the „Wait_Until_Signal_<b>Set</b>“ command with the signal name „<b>rob01_out</b>“</p> <p>Then unset the signal (by editing in the command line) of the robot:</p> <p><b>Remark:</b> The conveyor will wait until the robot will set the signal gibt and immediately after that the conveyor will unset the signal again.</p>	 <p>WAIT_UNTIL_SIGNAL_SET rob01_out</p> <p>rob01_out=0</p>
<p>7. Place the cursor after the command „ERC RELEASE DEVICE BOX_TUTORIAL“ and add the „Wait_Until_Signal_<b>Unset</b>“ command with the signal name „<b>conv_out</b>“</p> <p><b>Remark:</b> The conveyor will only go on when its signal is unset.</p>	<p>WAIT_UNTIL_SIGNAL_UNSET conv_out</p>
<p>8. Set the signal of the conveyor to „<b>conv_out=1</b>“</p> <p><b>Remark:</b> The conveyor will tell the robot that the workpiece is back.</p>	<p>conv_out=1</p>
<p>9. Save the program with Save</p>	
<p>10. Select the robot by using the Pull Down Menu from the Teach Window.</p>	
<p>11. To initialize the outgoing signal of the robot, set the cursor in the TeachWindow to line 5 (before of the “EndInit“-command) and add the command:</p>	<p>rob01_out=0</p>

## Connecting the programs

<p>12. Set the cursor after your comment „! Position for signal“ and add the „Wait_Until_Signal_<b>Unset</b>“ - command with the signal name „<b>rob01_out</b>“</p> <p><b>Remark:</b> The robot will only go on when its signal is unset.</p>	<p>WAIT_UNTIL_SIGNAL_UNSET rob01_out</p>
<p>13. Set the signal (by editing the command line) of the robot to „<b>rob01_out=1</b>“</p> <p><b>Remark:</b> The robot will tell the conveyor that the workpiece is standing onto the conveyor.</p>	<p>rob01_out=1</p>
<p>14. Add a „Wait_Until_Signal_<b>SET</b>“ - command with the signal name „<b>conv_out</b>“</p> <p>Then unset the signal (by editing the command line) of the conveyor:</p> <p><b>Remark:</b> The robot will wait until the conveyor tells that the workpiece is back and then the robot will immediately unset (reset) the signal of the conveyor.</p>	<p>WAIT_UNTIL_SIGNAL_SET conv_out</p> <p>conv_out=0</p>
<p>15. Save both programs with <b>Save</b></p>	<p></p>
<p>16. Save the work cell with the name <i>tutorial_multi_program_03.cel</i> in the directory: ../EASY-ROB / TRAINlib /</p>	<p></p>
<p>17. Start the simulation</p> <p>To run the simulation in a loop, just push the loop button straight after starting the simulation.</p>	<p></p> <p></p>

## 8 Appendix

### 8.1 Most important dialogues

#### Menu:

File Robotics Simulation 3D-CAD Tags View Aux ?

#### Toolbars:

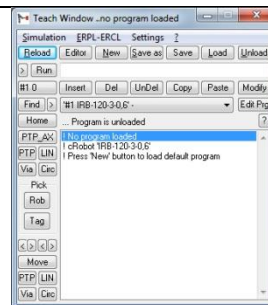

#### Teach Window

##### Menu:

Robotics > cRobot Program > Open Teach Window

##### Toolbar:

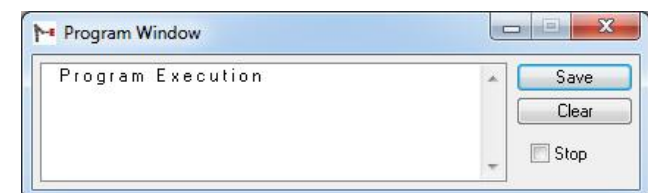

Create and change programs

#### Program Output Window

##### Menu:

Robotics > cRobot Program > Open Program Output Window

##### Toolbar:

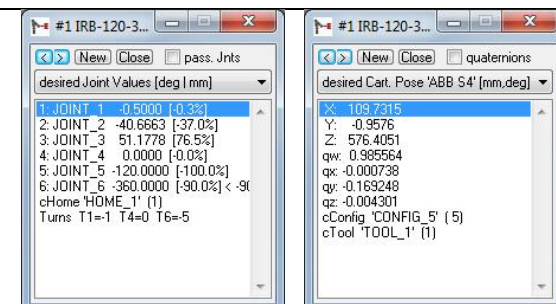

Shows you actual executed program line

#### Online Output Data Windows

##### Menu:

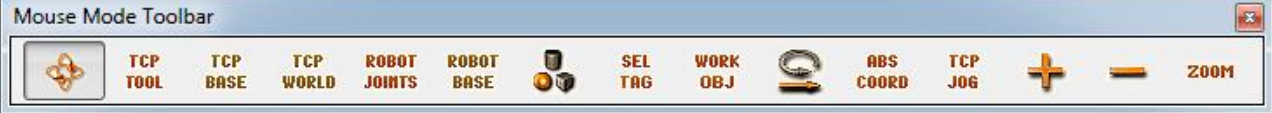

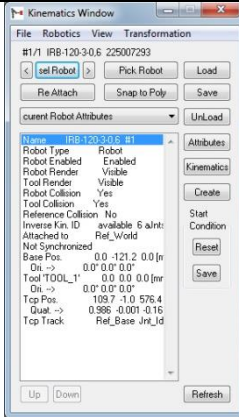

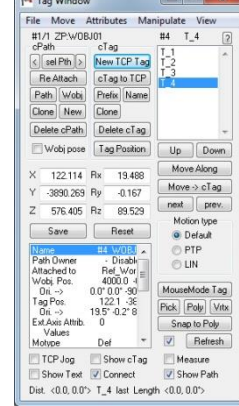

View > Open Online Output Data

##### Toolbar:

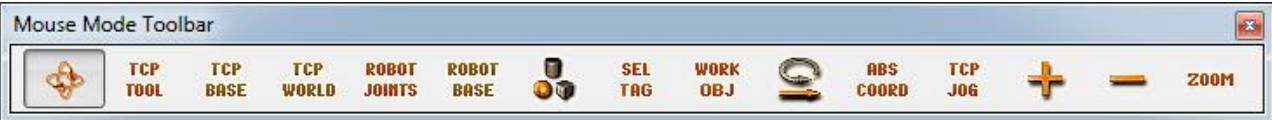

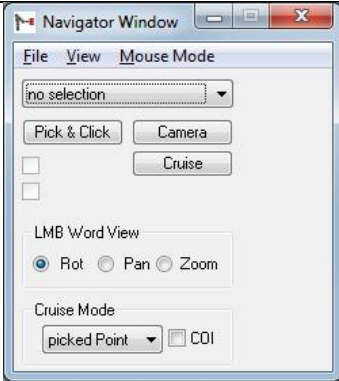

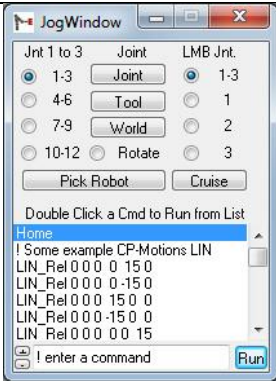

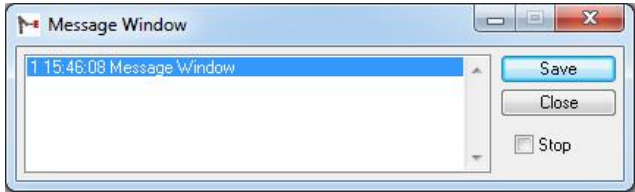

Shows you Joint values, TCP position, motion data

## Most important dialogues

<p><b>Menu:</b> File Robotics Simulation 3D-CAD Tags View Aux ?</p> <p><b>Toolbars:</b> Mouse Mode Toolbar</p> 	
<p><b>Kinematics Window</b></p> <p><b>Menu:</b> Robotics &gt; Open Kinematics Window <b>Ctrl+K</b></p> <p><b>Toolbar:</b></p> 	 <p>Create and change kinematics</p>
<p><b>3D-CAD Window</b></p> <p><b>Menu:</b> 3D-CAD &gt; Open 3D-CAD Window</p> <p><b>Toolbar:</b></p> 	 <p>Create, import and change geometry</p>
<p><b>Tag Window</b></p> <p><b>Menu:</b> Tags &gt; Open Tag Window</p> <p><b>Toolbar:</b></p> 	 <p>Create and Change paths and tagpoints</p>

## Most important dialogues

<p><b>Menu:</b></p> <p>File Robotics Simulation 3D-CAD Tags View Aux ?</p> <p><b>Toolbars:</b></p> 	
<p><b>Navigator Window</b></p> <p><b>Menu:</b> View &gt; Navigator Window      <i>Ctrl+N</i></p> <p><b>Toolbar:</b></p> 	 <p><i>Selecting by Pick &amp; Click</i></p>
